EDUCATION

Georgia State University

BSc Computer Science

Atlanta, GA

Aug 2016 - May 2021

WORK EXPERIENCE

Aegis Health Services

Full-Stack Software Engineer

Atlanta, GA

September 2025 - July 2026

- Engineered full-stack features across a clinical case management platform (React, Django, AWS API Gateway/Lambda) serving a large network of partner labs across Pharmacogenomics, Pathology, and Infectious Disease review workflows, including clinician-facing review interfaces with real-time autosave of case content
- Rearchitected the clinician compensation backend, replacing an inconsistent points-based system with self-serve flat and time-tiered pay schemes tied to case type; cut clinician payout costs 65% as case volume doubled and enabled Finance to manage rates and schemes independently via a custom Django Admin interface, with payouts calculated in real time on case completion
- Partnered with the clinical director to engineer a GPT-powered pharmacogenomics summarization pipeline that generated clinician- and patient-facing case summaries from clinical findings and lab reference data, easing manual reference review across a high volume of monthly reports; iterated on output reliability in response to clinical validation feedback prior to launch
- Engineered a new longform case type supporting a recurring-consult product line, snapshotting patient clinical context (medications, prior recommendations) into a versioned JSONB record per encounter to preserve what each clinician reviewed at the time of care
- Built an internal partner/patient intake API on AWS (API Gateway, Lambda); owned a compliance-focused status-tracking component built on an immutable, append-only event log, and implemented the platform's first SQS- and S3-based asynchronous handoff between backend systems to trigger downstream storage of clinical findings summaries

Itential

Software Engineer

Atlanta, GA

August 2021 - September 2025

- Delivered network automation solutions on the Itential platform for Fortune 500 clients including Verizon, Johnson & Johnson, Lumen, Northern Trust, and British Telecom, developing custom JavaScript and Python extensions to address use cases beyond the platform's native capabilities
- Identified a single-threaded processing bottleneck in Verizon's 5G router config conversion utility (Nokia/Alcatel-Lucent/Cisco → Ciena) that took 20 hours to run across ~10,000 devices; parallelized the workload using Python multiprocessing, cutting runtime to 2 hours
- Built an Itential-driven F5 load balancer upgrade automation for Northern Trust's 1,000+ appliance production fleet via custom SSH/CLI orchestration against F5 tmsh; implemented HA-aware sequencing (upgrade secondary, role-swap, upgrade primary), pre/post-check guardrails covering firmware integrity, HA sync health, and system resource thresholds, and ServiceNow change-ticket integration; gathered requirements directly with Northern Trust's network engineering team and F5 solutions architect

TECHNICAL SKILLS

Programming Languages: JavaScript, TypeScript, Python, C#

Technologies: Git, Docker, Terraform, Visual Studio Code, GPT, CI/CD, Agile, AWS

Backend Technologies: Django, RabbitMQ, Node.js, MongoDB, PostgreSQL, FastAPI, Redis

Frontend Technologies: React, Motion, Tailwind CSS, HTML, CSS, Vite

PERSONAL PROJECTS

Simple Trivia Game · React, Next.js, TypeScript, Socket.IO, Motion, Postgres, Redis — simpletrivia.io

Built a full-stack trivia platform with real-time WebSocket gameplay via Socket.IO and Redis-backed session/score state, a Question Editor supporting custom and curated question sets, a moderated community Trivia Workshop, friend system, and guest play.

Helical · TypeScript, tRPC, Next.js, Python — helical.video

Building an automated round-trip digital-to-VHS-to-digital service that gives personal and commercial video projects an authentic analog look, featuring a customer-facing web portal, a Python edge-worker pipeline for hardware playout and digitization, and an approval-based order flow with deliverable generation and payment capture.

Microsoft Visual Studio Code · JavaScript — github.com/microsoft/vscode

Merged PR: Added Open Active Diff Side command to the Command Palette, closing a gap where keyboard-only users had no way to open the active file's diff view on a specific side.
